

The Problem

As users browse the internet, data is being downloaded to their local machine. This browser data is required to allow the browser to work effectively. However, some of this browser data is collated by third parties who are using it to send targeted advertisements and track user behaviour. Web data is now being recognised as an issue within enterprise environments which impacts user experience and increases infrastructure costs.

The Solution

Avanite's WebData Control is the only software which fully addresses the issue of browser data in enterprise environments. You can granularly define what data is kept and what data will be removed ensuring only data essential to your business is retained. This vastly reduces the amount of unnecessary data being accumulated in your environment.

Faster Login Times

Profile bloat has always been an issue for environments with roaming users, the larger the user's profile the longer it will take for a user to logon. Browser data can add 100s of megabytes to a user's profile a large portion of which is not essential for the browser to work. By implementing WebData Control enterprise businesses on average see a 60% improvement on their user logon times.

Reduced Infrastructure

Every browser generates a large amount of data for the browser to function, this data needs to be stored. This data increases the infrastructure storage costs and the volume of traffic across your network as your users logon and logoff their machines. WebData Control reduces the storage requirements for each browser and therefore reduces volume of traffic across your network.

Complete Cookie Management

Currently enterprise environments have an all or nothing approach to managing internet cookies, you either capture and manage all browser generated cookies or nothing at all. This gives administrators a problem as they cannot keep only the critical cookies that their users need. WebData Control is the only solution available today that provides complete administrative control over internet cookies. You can granularly define which cookies are to be retained and which are to be removed.

Multiple Browser Support

Certain websites require explicit features that are not available on all internet browsers. Therefore, enterprise environments need to support these multiple browsers. WebData Control can manage browser data across all the common internet browsers including: Internet Explorer, Microsoft Edge, Google Chrome and Mozilla Firefox.
